

3D Object Detection of 9-million LiDAR Point Cloud Using Semi-Supervised Machine Learning

Siamak Rabienia

Fall 2019

Data Collection & Preparation

- The dataset are acquired by HDL-32E
 - ± 2 cm accuracy
 - 32 Channels
 - 80m-100m Range
 - 700,000 Points per Second
 - 360° Horizontal FOV
 - +10° to -30° Vertical FOV
- The dataset has been labeled
- Metric: Misclassification Rate

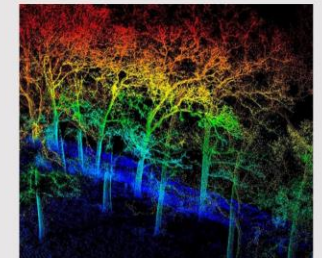

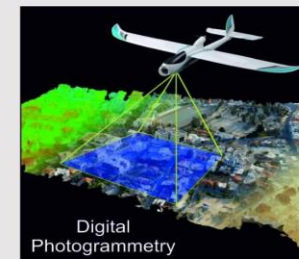

Problem Definition

Objective: Reconstruct the 3D objects in a local neighborhood with minimum dimension

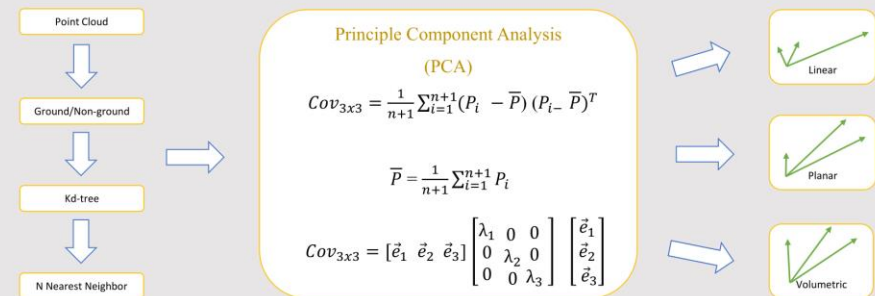

Motivation: Minimize the Misclassification Error

Applications:

- Autonomous Driving (LYCMU, CVPR '19), (CKZBMFU, NIPS '15), (FDU, NIPS '12)
- Digital Photogrammetry (HH, ISPRS '18)
- Forestry & Vegetation (DMS, CVPR '12)

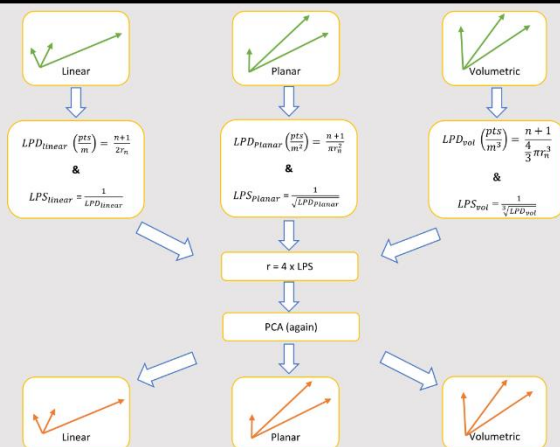

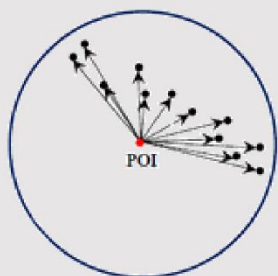

Method

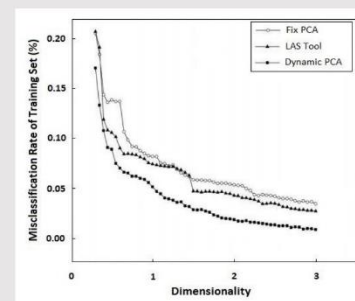

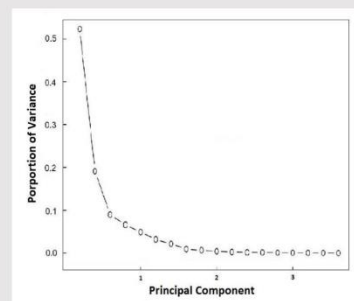

Dynamic PCA

- Local Point Density (LPD)
- Local Point Spacing (LPS)

Misclassification

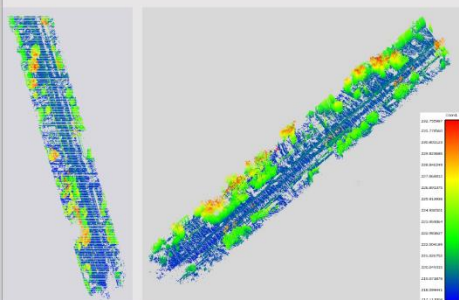

$$\text{Misclassification Rate} = \frac{1}{n} \sum_{i=1}^n I(y_i \neq \hat{y}_i)$$
